

- Raise the Screen to the highest.
- Remove the “black cap” under the screen by removing the 2 screws at the front as well as the 2 screws (1 on each side) on the sides.
- 

Remove the 4 screws (2 on each side) which also hold the GPS support by replacing them with the 4 screws supplied M6 X 25.

Slide the screen protector from the front, on the tank side, having previously glued the rubber pads used to protect your screen.

Fit the M6 washers and the nuts. approach the nuts without blocking, place your protection correctly then moderately block the nuts (a little medium thread lock does not harm).

Put the cap back on before returning your Screen to its initial position.

Note that the plastic spacers provided in the hardware kit are only used in the event that you are not equipped with the GPS support bar, they compensate for the thickness.
